

Nexidia Analytics

API/SDK Overview

Release: Nexidia Analytics

Document Revision: A1

Distribution Status: Published

Publication Date: March 2023

PROPRIETARY AND CONFIDENTIAL INFORMATION

Information herein is proprietary information and trade secrets of NICE Ltd. and/or its affiliated companies (Affiliates). This document and the information herein is the exclusive property of NICE and its Affiliates and shall not be disclosed, in whole or in part, to any third party or utilized for any purpose other than the express purpose for which it has been provided.

IMPORTANT NOTICE

Subject always to any existing terms and conditions agreed between you and NICE or any Affiliate with respect to the products which are the subject matter of this document, neither NICE nor any of its Affiliates shall bear any responsibility or liability to a client or to any person or entity with respect to liability, loss or damage caused or alleged to be caused directly or indirectly by any product supplied or any reliance placed on the content of this document. This includes, but is not limited to, any interruption of service, loss of business or anticipatory profits or consequential damage resulting from the use or operation of any products supplied or the content of this document. Information in this document is subject to change without notice and does not represent a commitment on the part of NICE or any Affiliate.

All information included in this document, such as text, graphics, photos, logos and images, is the exclusive property of NICE or in Affiliate and is protected by United States and international copyright laws. Permission is granted to use, view and photocopy (or print) materials from this document only in connection with the products to which this document relates and subject to the terms of license applicable to such products. Any other use, copying, distribution, retransmission or modification of the information in this document without the express prior written permission of NICE or an Affiliate is strictly prohibited. In the event of any permitted copying, redistribution or publication of copyrighted material, no changes in, or deletion of, author attribution, trademark legend or copyright notice shall be made.

Products supplied may be protected by one or more of the US patents listed at www.nice.com/Patents.

SDK Overview

This document provides a brief summary / overview of the SDKs available for NICE Nexidia, providing a convenient listing of those, as well as some examples of use cases for which they might be used.

DOCUMENTATION REVISION HISTORY

REVISION	DATE	DESCRIPTION
A0	April 2020	Initial version.
A1	March 2023	Formatting.

NEXIDIA DATA EXCHANGE FRAMEWORK

Overview

In addition to the core set of actions already available within the Data Exchange Framework, Java developers can also use the provided Eclipse SDK project to create new actions that are fully integrated with the Data Exchange Framework, and cover any gaps in functionality that may be desired for the project.

Abstractions exist that simplify the most common processing scenarios, making working table management, multi-threading, user interface changes, and other Data Exchange Framework internals transparent. Once coded, deployment to the framework is as simple as exporting a JAR file of new actions and uploading it through the Nexidia Data Exchange Framework Admin Tool server user interface. The JAR file is automatically distributed to all connected Nexidia Data Exchange Framework Server Tool servers, and new actions are immediately available for use throughout the system.

Example Use Cases

Internal to Nexidia, the Data Exchange Framework SDK is tactical tool used in the field when time lines and requirements fall outside of the regular development cycle, and commonly used custom actions would eventually become candidates for absorption into the core set of actions. These are examples of possible use cases:

- Updating audit information in a remote database at the end of each process run.
- Retrieving media files from custom appliances like Hitachi, Centera, AmazonS3, etc., based on incoming metadata.
- Extracting supplemental business data from outside APIs to join to metadata rolling through a process.
- Using Nexidia's Workbench (embedded in DEF) to manipulate media.
- SDK Introduction - Nexidia Analytics Nexidia Data Exchange Framework (A0).
- Alternatively, the DEF's out-of-the-box Custom SQL action provides full metadata manipulation capabilities, and its Executable Wrapper action can call arbitrary executables against incoming file metadata; so a custom action may not always be the most straightforward path to filling functionality gaps.

NEXIDIA DATA EXPORT UTILITY

Overview

Nexidia Analytics is an open data platform. The client data warehouse and analytics platforms can consume the data generated by client systems for additional reporting. The Data Export Utility (DEU) provides a solution to send Nexidia Analytics data back to client systems in an organized, secure, and consistent way. It has a minimal footprint in the Nexidia Analytics databases because it uses a separate Export Tracking database on the same server as the Nexidia ESI and Nexidia ESIDW databases.

Example Use Cases

- Exporting data from NICE Nexidia Analytics and Quality Central for use in Enterprise predictive models.
- Combining NICE Nexidia Analytics and Quality Central data with other corporate data for enterprise reporting purposes.

NEXIDIA ANALYTICS AGENT AND USER IMPORT SERVICES

Overview

NICE Nexidia Analytics User and Agent Import Services are used for automating maintenance of User and Agent personnel (user accounts) from an external system in the NICE Nexidia Analytics and Quality Central applications.

Example Use Case

A customer with agent and/or user records maintained in a third-party system may utilize these services to automate the creation and maintenance of those records.

NEXIDIA ANALYTICS NAMED SET SERVICE

Overview

Nexidia Analytics provides a concept called “Named Sets”. A Named Set is a collection of calls or media (referred to here after simply as “media”) that can be arbitrarily created for searching within the Nexidia Analytics Search application.

Example Use Case

A customer has an application that is aware of interactions within the NICE Nexidia system and wishes for a subset of those interactions to be presented so that they can be searched or played.

NEXIDIA REAL-TIME GRID

Overview

This API is Internal to Nexidia Real-Time Interaction Guidance which is Nexidia's real-time monitoring and decision engine, driving specific actions to the agent desktop, in real-time, based on live voice interaction activity. It has a sub-second latency (between 500-1500 milliseconds) where the engine scans the audio in real-time, and then shows alerts based on pre-defined rules. These rules may be customized to accommodate for multiple scenarios:

- Compliance & Script Adherence - The agent failed to read Mini-Miranda within the first 15 seconds of the interaction. The agent desktop provides a link to a script of the Mini-Miranda to assist the agent.
- Complaints – Prompt the agent to follow proper procedures to deal with a customer complaint.
- Escalation - The customer says, "I need to cancel my account" or "I need to speak to a supervisor or manager". The agent is provided guidance to advance the call to the customer retention department.
- Authentication - The agent is prompted to complete secondary authentication if the customer was not previously authenticated

Example Use Case

The customer wishes to send the alerts to agent desktop within their existing desktop application (rather than the desktop portion of the Real-Time Interaction Guidance product).
