

NiCE Text Grid System Requirements Guide Version 20.2.0.2

Introduction

This topic lists the requirements that your system must meet before you begin installing NICE Text Grid.

System Requirements

Servers below these specifications have not been tested with Text Grid and are ineligible for technical support. Less capable servers may be usable for non-production purposes if the administrator monitors for resource exhaustion, particularly memory.

Component	Minimum	Recommended (if different)
Processor	Intel Xeon X5670, 2.93GHz, 6 cores	
	No more than 64 logical cores if running under Windows.	
RAM	64GB/48GB	
	In order to run on 48G machines, it is recommended to change the Search Node JVM memory to 8G. This is done in the treeconfigurer on the Search Heap Size page or by passing a --heapsize parameter to the treeconfigurer. In all cases, the value is in Gig (so 30 == 30 Gig).	
Available Disk Space for	500MB	

Installation

- 10GB (fixed, regardless of input data size or type)
- Best case: emails with mixed attachments, 10% of source document size
- Worst case: chats in .nxchat format, 200% of source document size

Sizes do not include storage for source documents.

Available Disk Space for Data Files

The Search Node also has default thresholds that will start reporting warnings and then errors if the total amount of space occupied on the data directory disk exceeds 90% or 95% respectively. This means that it is generally a bad idea to share the space on a Search Node hard drive with other non-Text Grid data. If you do need to tweak these thresholds, consult the Administration Guide section on Watermark Settings.

The storage numbers in this document can be used as a guideline, but actual requirements can vary widely depending on the nature of the source documents. It is strongly recommended to measure actual requirements in a pilot program using representative source documents.

These guidelines assume the source documents are uncompressed.

Other Hardware

- One 1GB NIC

Operating Systems

- Windows Server 2016, 2019

While Elasticsearch is installed as part of the TextGrid 2.0 install, in order to use some features, including AD Authentication, Snapshots, and Cross Cluster Replication, you must install an Elasticsearch License purchased either from NICE or directly from Elasticsearch.
