

Playing Back Interactions

There are two playback options:

- Click Play to start playing the interaction.
- Click Remote Playback to log in remotely. After you log in, the Player opens in a new window and the interaction is played back.

If the Play or Remote Playback buttons are not available, make a note of the Interaction ID and access it directly from the original recording source.

If the Playback.EnforcePlaybackAuthorization parameter in the Management Console is set to true, then your administrator can configure you to have permissions for specific sessions, data restrictions, and hierarchies. If you try to play files you do not have permission to play, the following error message displays: "User doesn't have access to view/play the requested media [media_ID]."

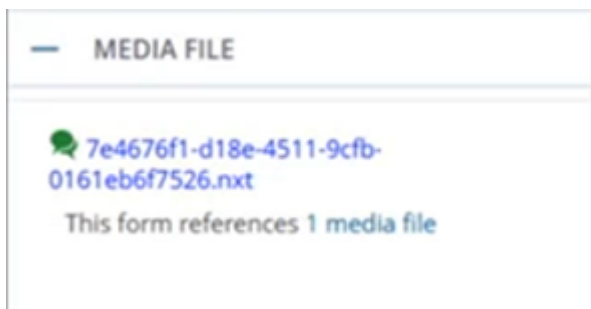

Pluggable Player

The pluggable player is a standalone player that opens in a new window when you click an interaction to review. The left side panel is collapsible.

The Playback.Enable.PluggablePlayerForChat Management Console configuration enables playback of screen recordings while viewing a chat in the pluggable player.

Chat evaluations with screen recordings - You can click the media file name in the media file area to launch the Pluggable Player with chat interactions and agent's screen recording. The Pluggable Player is not accessible through the <n> media files or external player links.

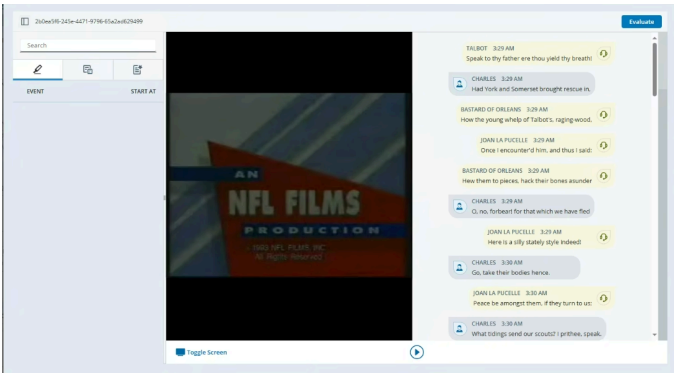

View Image

Launching the Pluggable Player offers the following benefits:

- Provides a comprehensive view of chat interactions allowing reviewers to simultaneously analyze the agent's screen actions and chat conversations in a unified, interactive playback experience. This leads to more accurate and efficient evaluations.
- Solves the timestamp tracing issue for multiple chats. Earlier, clicking a chat only opened chat bubbles, making it difficult to trace actual timestamps in recordings with multiple chats. Now, when a user clicks a chat with screen recording in the evaluation form, the Pluggable Player launches, aligning chat content with visual context.

External Playback

The External Playback option allows users to access third-party interactions from QC Evaluation Form templates. The tooltip displays the external URL when you hover the mouse over the external link. The external playback link in the metadata requires configuration from the customer.

If you try to play or download a locked CXone interaction, you will see an error message. The interaction might be locked to prevent media playback for VIP calls or for interactions older than 3 months. To unlock the interaction, contact your administrator.

You can control the display of internal media link. To hide the internal media link, go to Evaluation Portal > QC Admin > Localization > Settings, and select Hide internal media link in EFI.

To configure external playback:

1. In the QC Portal from Administration > Settings, select from the dropdown which metadata field in the evaluation form template will link to the third-party interaction. Click Save.
2. To add an external link to a template, you must add the relevant metadata category to the template Metadata section. Add the relevant field, click **Add**, and then click OK.

View image

3. The External Link will display as an option in the Media File section of the Evaluation Form Template.

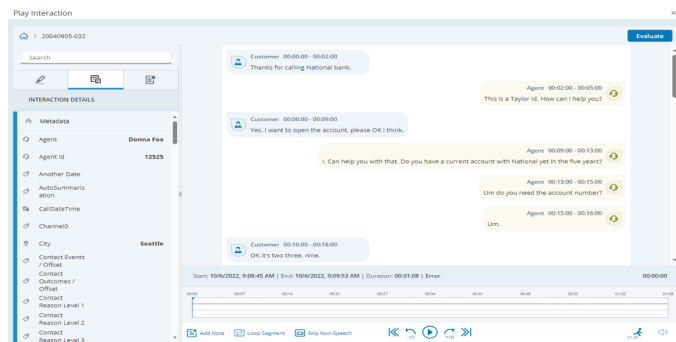

You can view the following during playback:

Customer and agent information is displayed in the waveform. When you play back interactions using the Play button, you can view and add:

- General notes
- Notes on a specific location within the interaction
- Tags

Playback is site-dependent. Agent and supervisor privileges depend on the administrator's system configuration. For example, agents can edit and delete their notes, and supervisors can edit and delete anyone's notes.

The player's left side shows the hits, metadata of the interaction, and the Topic AI data (Summary, Intents, Actions and Outcomes). You can also search for keywords in the player.

The following controls are available while you are listening to an interaction:

- Evaluate - Evaluate an agent.
- Hit Marks - The vertical color-coded lines that signify the location of the hits within the file. Hit marks identify non-talk time and the search terms, queries, and term lists used.
- Add Note - Add a note about a selected hit.

- Toggle Segments - Toggles customer or agent crosstalk and non-speech segments. Crosstalk is identified by shading the area of both the agent and customer channels for the duration of the crosstalk.
- Loop Segment - Repeats the segment.
- Skip Non-Speech - Skips over non-speech in the call.
- Previous Hit - Plays the previous hit.
- -10 - Goes backward 10 seconds.
- Play/Pause - Starts and stops playback.
- +10 - Goes forward 10 seconds.
- Next Hit - Plays the next hit.
- Speed Control Slider - Displays current speed rate.
- Volume Control Slider - Raises or lowers volume.
- Toggle Screen - Toggles a view in a video file.

When two or more agents are recording their screens, only the screen of the agent who is being evaluated is played back.

To learn how to add notes to an interaction, see [Adding Notes to an Interaction](#).

To learn how to assign a tag to an interaction, see [Assigning a Tag to an Interaction](#).
